**Do I have and is it 32bit or 64 bit Operating system?**

A 64 bit operating system is an operating system that has been purposely developed for a computer with a 64 bit processor. You cannot use 64 bit software on a computer with a 32 bit processor but you can use 32 bit software with a 64 bit processor. When dealing with your AES software (DT Trainer or Activity Trainer) a common question we will ask you in the support process is whether you have a 64 or 32 bit operating system.

What operating system do I have and is 32 bit or 64 bit?

- Go to the start menu.
- Choose all programs.
- Then choose accessories, then system tools.
- Now choose system information.
- See the screen shot below.

If it says x86 then you have a 32 bit operating system. If the system type area mentioned a 64 or AMD64 then this means you have a 64 bit processor. If it said Microsoft Windows XP Professional x64 Edition Version then this means it is a 64 bit operating system. However, if it says Microsoft Windows XP Professional and the processor starts with X86 so therefore this is a 32 bit processor with a 32 bit operating system.
